# Agenda

- 01 What is Data Normalization?
  - 02 Examples in the Wild
  - 03 Z Scores
  - 04 Parallel Coordinates / Radar Charts
  - 05 Preparing Data with Tableau Prep
- 

# What is Data Normalization?

And why do we need to do it?

# What is Data Normalization?

Why do we need to do it?

- The process of transforming data from various sources into a consistent format
- Allows for easier analysis and comparison by adjusting values to a common scale
- By normalizing the data you have the ability to compare like for like
- This can make your data easier to understand, give you more relevant analysis, or sometimes both!

# What is Data Normalization?

and why do we need to do it?

# What is Data Normalization?

and why do we need to do it?

Min Max Norm.

# What is Data Normalization?

and why do we need to do it?

## Examples in the Wild

CONFERENCE

# Calculating Z Scores

# What is a Z-Score?

A z-score is a statistical measure that describes how many standard deviations a data point is from the mean of a dataset.

- It helps to understand the relative position of a value in a distribution.
- Finding common patterns within different groups of data points.
- They are used to derive t- and p-values (Math..shivers).

## Interpretation:

- A z-score of 0 means the data point is exactly at the mean.
- A positive z-score indicates the data point is above the mean.
- A negative z-score indicates the data point is below the mean.

# Why would you calculate Z-Scores?

(Other than for calculating t- or p-values....)

- Do we have outliers? Control Charts
- Peer to Peer comparison, Scatter Plots
- Enhance Box Plots
- Comparing Multiple Data Points

# How to calculate a Z-Score

(Actual Value - Average Value)

---

Standard Deviation of Values

Let's do this in Tableau ....

**DEMO**

# Parallel Coordinates & Radar Charts

Using Standardization

# What is a Parallel Coordinate Chart?

A parallel coordinate chart is a data visualization technique used to display multi-dimensional data

- Multiple Dimensions
- Data Points as Lines
- Parallel Axes
- Visualizing Trends
- Overlapping Lines

# Why would you use one?

- Handling High-Dimensional Data
- Detecting Patterns and Relationships
- Visualizing Trends Across Multiple Variables
- Comparing Multiple Data Points
- Exploratory Data Analysis (EDA)
- Handling Complex Interactions

# Requires Standardization

$$\frac{(\text{Actual Value} - \text{Minimum Value})}{(\text{Maximum Value} - \text{Minimum Value})}$$

Creates a score between 0 - 1

Let's do this in Tableau

**DEMO**

# What is a Radar Chart?

- Represents the same as a Parallel Coordinate Chart but in a circular format
- Common in performance metrics, especially sports

# DEMO

# Preparing the Data with Tableau Prep

# Why use Prep?

- If no filtering is needed on the Viz itself or if filtering is not to affect the normalization.
- Some calcs can be slow depending on the number of data points being visualised (Table Calcs or LoDs)
- Can still be refreshed with new data by just running the Prep Flow first

**Let's show you in Prep!**

# Key Takeaways

## Z-Scores

It helps to understand the relative position of a value in a distribution.

Good at group to group comparison and spotting outliers.

## Normalization

Comparing and ranking of values on the same axis.

Good at visualizing highly dimensional data and bring forward trends & patterns.

## Using Prep

Normalize data pre-viz-ing, to reduce complexity and potential load times.

Keeps the baseline the same regardless of filters.

**Thank you**

# Coffee's on us.

The first 1,000 DataFam to provide feedback on this event will receive a \$5 Starbucks gift card.\*

1. Download the Salesforce Events app.
2. Scan the QR code or navigate to My Event, then My Surveys.
3. Take four session surveys and the event survey.
4. Redeem your gift card at Badge Pickup on Thursday.

\*Restrictions apply. See terms and conditions at [sforce.co/survey-terms](https://sforce.co/survey-terms).
